

## CHAPTER 1

---

# Solving Quadratics

A quadratic function has three terms:  $ax^2 + bx + c$ .  $a$ ,  $b$ , and  $c$  are known as the *coefficients*. The coefficients can be any constant, except that  $a$  can never be zero. (If  $a$  is zero, it is a linear function, not a quadratic.)

When you have an equation with a quadratic function on one side and a zero on the other, you have a quadratic equation. For example:

$$72x^2 - 12x + 1.2 = 0$$

How can you find the values of  $x$  that will make this equation true?

You can always reduce a quadratic equation so that the first coefficient is 1, so that your equation looks like this:

$$x^2 + bx + c = 0$$

For example, if you are asked to solve  $4x^2 + 8x - 19 = -2x^2 - 7$

$$4x^2 + 8x - 19 = -2x^2 - 7$$

$$6x^2 + 8x - 12 = 0$$

$$x^2 + \frac{4}{3}x - 2 = 0$$

Here,  $b = \frac{4}{3}$  and  $c = -2$ .

$x^2 + bx + c = 0$  when

$$x = -\frac{b}{2} \pm \frac{\sqrt{b^2 - 4c}}{2}$$

What does this mean?

For any  $b$  and  $c$ , the graph of  $x^2 + bx + c$  is a parabola that goes up on each end. Its low point is at  $x = -\frac{b}{2}$ .

If there are no real roots ( $b^2 - 4c < 0$ ), which means the parabola never gets low enough to cross the  $x$ -axis:

If there is one real root ( $b^2 - 4c = 0$ ), it means that the parabola just touches the x-axis.

If there are two real roots ( $b^2 - 4c > 0$ ), it means that the parabola crosses the x-axis twice as it dips below and then returns:

**Exercise 1**      **Roots of a Quadratic***Working Space*

In the last chapter, you found that the function for the height of your flying hammer is:

$$p = -\frac{1}{2}9.8t^2 + 12t + 2$$

At what time will the hammer hit the ground?

*Answer on Page 5***1.1 The Traditional Quadratic Formula**

If the last explanation was a little tricky to understand the quadratic formula is a nifty tool.

**The Quadratic Formula** $ax^2 + bx + c = 0$  when

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

# Answers to Exercises

## Answer to Exercise 1 (on page 3)

For what  $t$  is  $-4.9t^2 + 12t + 2 = 0$ ? Start by dividing both sides of the equation by  $-4.9$ .

$$t^2 - 2.45t - 0.408 = 0$$

The roots of this are at

$$x = -\frac{b}{2} \pm \frac{\sqrt{b^2 - 4c}}{2} = -\frac{-2.45}{2} \pm \frac{\sqrt{(-2.45)^2 - 4(-0.408)}}{2} = 1.22 \pm 1.36$$

We only care about the root after we release the hammer ( $t > 0$ ).

$1.22 + 1.36 = 2.58$  seconds after releasing the hammer, it will hit the ground.
